

An essential guide to nylon, flourocarbon and braided main lines.

WHAT LINE IS BEST FOR YOU?

WHAT BRAID IS BEST FOR YOU?

WHAT WILL YOUR LINE ACTUALLY BREAK AT?

As so many lines are labelled the same but behave very differently, we suggest buying line by diameter rather than by the breaking strain on the label.

For weed and snag free situations...

We recommend lines of between 0.33mm and 0.35mm. These will usually break between 16lb and 18lb.

For waters with snags and heavy weed...

Thicker lines of between 0.35mm and 0.40mm will have better abrasion resistance and be stronger, usually breaking between 20lb and 22lb.

For distance casting...

Lower diameter lines of 0.25mm to 0.30mm generally enable longer casts and will usually break between 10lb and 15lb.

One last thing...

Remember, diameter and breaking strain do not give the complete picture. Cost, suppleness, abrasion resistance and value for money should also be considered.

Braid can be an essential part of any angler's tackle, but there are a few things to consider when choosing which one to buy...

FLOATING BRAID

Ideal for marker float use, spodding / spombing or drifting and lure fishing for pike.

SINKING BRAID

Ideal for pinning down main line when a much less detectable approach is required.

Braid, the pros...

Most braids are exceptionally thin, making them superior casting lines, and have virtually no stretch, which improves bite indication, makes them more sensitive for feature finding and ideal for spodding / spombing. Braids generally deteriorate a lot more slowly than nylon or fluorocarbon, so the need to re-spool is less and it is also less troublesome with line twist.

Braid, the cons...

Care must be taken when spooling new braid. It is important not to overfill your reels otherwise wind knots will occur, and it is best loaded on to your spools wet and under tension. The lack of stretch in braid can result in fish losses due to hook pulls or hook link breakages, so extra care needs to be taken when playing fish, and this zero stretch can also result in a broken rod if the braid gets wrapped around rings during casting or general handling.

Almost every line commonly used for carp fishing has an underrated breaking strain indicated on the spool or box. With a good knot, most lines will always break at a higher strain.

With no international guidelines for indicating breaking strain or diameter, most manufacturers underrate lines to different degrees. A line labelled 12lb by one company may consistently break around 20lb, whereas a line labelled 12lb by a different company may regularly break at just 14lb. To give a better idea of the specifications of the main lines that we sell we have tested breaking strains and diameters ourselves.

How we measure the breaking strain

We took line from different points on the spool and measured breaking strains five times using our own custom and precision made line tester, and diameters using a high quality digital calliper. Breakage tests were conducted with five turn grinner knots and a knotless knot to mimic what the average angler uses. Braid diameters shown below are as accurate as possible, but unlike nylon lines, some braids do not have round profiles. Each spool of line was tested brand new, but we accept that the performance of most lines varies with age, and that different batches of lines supplied to shops may show slight differences in performance. However we hope the chart will provide useful general guidance.

LINE TESTS

NYLON MAIN LINES

For the purpose of our line tests we use a Five Turn Grinner Knot. Our experience and manufacturers suggestions however, sometimes suggest that a Palomar Knot or Tucked Blood Knot can often give higher breaking strain results.
